New method for increasing the prollierative capacity of cell lines comprises the bilarceins aperts recognify activities (electric activity and reversibly inactivating RD/INK4 and/or p53 pathways useful in treating age related discases

Lain 5; Page 121-123; 123pp; English.

The invention concerns methods and readents for extending the life span, activation of mitotic divisions, of a cell. The method relies on artivation of an telemenase activity and inhibition of once to both of a retination of the life span division cycle. Building of INK4 and cdk6, releases the cells into the division cycle. Binding of INK4 tamily members, e.g. the tumour suppressor picknear, inhibits binase activity and results in growth arrest. Refunctivators can selectively and results in growth arrest. Refunctivators can selectively and recessibly inactivate an superiors. Refunctivators can selectively and recessibly inactivate and strost. Refunctivators can selectively and recessibly inactivate and strost. Refunctivators can selectively and recessibly inactivate and safe on a sead in the methods other molecules which can suppressor also also be used in the methods other molecules which also be used in the methods of the molecules which there it may not or more or residues K22, R24, H95 and/or D97. With all oncomponent why also be used. The methods are useful for the Rb and picinked applicative capacity of cells. The cells are increasing the profilerative capacity of cells. The cells are subsequently of use in pharmaceutical and commette preparations and arterosclerosis. The cells can also be used to replace tumour cell increasing and differentiation. Long lived (immortal) cells could also be belonesed in the products.

                      anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) countries a sequence (S) solected from 8447 sequences (given in AHEFEGA to AHIZOIIO), or is at least 95% identical to (S), where a change in activity of is at least 95% identical to (S), where a change in activity and can be used for producing a product which an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          182 CATTATGLCAGAAATTAAAGATACCAGATCATCLCAGAGAGAGAGCLLGGLLAACLLGGG 241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This gene encodes a protein, the absence of which is associated with a normalism. It is used to produce an antibody to the protein, contacting this with the tumour sample and detecting immune complexes as indication. If he presence in the tumour sample of the protein. Whole sequence or a unique sub-region can be used. The method identifies parients lacking the detective refinoblastoms (Rb) allele and thus are not at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            64 CONCEGERACIONOGO CONTROLISMOS ASSESSORAS CARACTARISMOS 123

anticancer agent is used for the treatment of cancers such as breast bladder, skin, stomach, liver, colon and oral cavity, lymphoma and leukacharia. The anticancer agent induces apoptotic death, of cancer cells and the Rb inhibitor increases the apoptosis inducing activity of myoclacion even in Ph-positive cancer cells. The agent is specific to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          myroramings even in Phippsilive cancer cells. The agent is specific to cancers in which Rb proteins are optionally expressed and myrolactone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         122 CGGAGGACCTGCTCTCGTCAGGCTTGAGTTTGAAGAAACAGAAGCAGATTTTACTG 181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    302 GGGGAAICTGTATTTTTGCAGCAGTTGACCTAGATGTGTGGTTTTACTG 361

This sequence encodes a modified tetinoblastoma tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting callular prollieration, when coadministered with a p53 protein. The RISPs can be used for treating diseases characterised by abnormal cellular prollieration, particularly cancers. The RISPs have a broader spectrum of

This sequence encodes a modified retinoblastoma tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting cellular proliferation, when coadministered with a p53 protein. The KISPs can be used for treating diseases characterized by abnormal cellular proliferation, particularly cancers. The RISPs have a broader spectrum of

protein (RISP) of the invention. The proteins can be used for inhibiting coliular proliferation, when enadministered with a p53 protein. The RISPs can be used for treating diseases characterised by abnormal cellular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proliferation, particularly cancers. The RISEs have a broader spectrum of activity than wild type RISEs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           81 LeupheAlaLeuPheSerLysLeuGluArqThrCysGluLeuIleTyrLeuThrGlnPro 100

```
protein (RTSP) of the invention. The proteins can be used for inhibiting celular proliferation, when coadministered with a p54 protein. The RTSPs can be used for treating diseases characterised by abnounal cellular proliferation, particularly cancers. The RISPs have a broader spectrum of activity than wild type RISPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           <u></u>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of the retinoblastoma gene which encodes the retinoblastoma (MR) protein which may be used as part of a method of controlling cell cycle progression which may be used in confination with therapeutic methods to arrest tumourigeness in organisms. The real cycle can be reversibly arrested in a convenient and sale and nearest. The protein is used in a companient and sale and reality obtainable, and shows little or no texic effects on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               healthy cells. It is also compatible with other methods and devices for requisiting certain physiological processes of the body, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 blood cell produ, and qumete produ. Fragments of the protein are soluble in low concus, of diversal thus enhancing their value in

protein RH (see AAM62465). A new claimed polypeptide is a fusion of:
(i) a transcription factor (IF) comprising a DNA binding domain,
and (ii) a retinoblastomma (Rb) polypeptide that includes a growth
suppression domain. Also new are: (1) a nucleic acid encoding the
fusion protein, and (2) expression vectors containing such DNA.
The fusion protein, particularly expressed from gene therapy HTTTFTHTHTHTHTHTHTHTHTHTHTH 259 GACCOGOCICING INGOINAGE IN TRANSPACACAGAGAGAGCON GALLITACTICATOR 318 379 GITTCATGIGGAIGGAGIATIGGGAGGITATATATICAAAAGAAAAAGGAACTGIGGGGA 438 319 1010740AAATTAAAGATACCAGATGATGTCAGAGAGAGGTTGGTTAACTTGGGAGAAA 378 vascular disease. Tissue specific expression of E2F-PR factors is provided. The fusion proteins are more effective in repressing transcription of the E2F promoter than Rb alone and cause cell-cycle. 1 Met ProproLysThrProArgLysThrAlaAlaThrAlaAlaAlaAlaAlaAlaGluPro 20 This nucleotide sequence includes a coding region for retinoblastoma vectors (especially ademovirus vectors), is used to treat the properties of the properties of the properties of the properties of the bladder) or restenosis (after angloplasty), but also diabetic retinopathy, thyroid hyperplasia, Grave's disease, psociasts, retinopathy. peniqu prostatic hypertrophy, Li-Fraumeni syndrome and peripheral New fusion polypeptide of, e.g. franscription factor - used to freat, e.g. hyper-proliferative disease such as cancer and Sequence 2994 BP: 974 A: 618 C: 593 G: 809 T: 0 other; Conservative: Mismatches: 21 ProAlaProProProProProProProGlu-----Matches: Length: Indels US 09 026 459A 39 (1 851) x AAV40004 (1-2994) WILLS KN; Example 1: Fiq 2A: 91pp: English. arrest in a variety of cells. 97WO - US21821. 970S 0801092 96US 0751517 4 1 1 1 5 0 91.70**%** 91.70**%** 38.85 Antelman D. This sequence represents the wild type human retinoniastoms as us. The invention relates to a method of detecting a mutated retinoblastoms (mRP) norther actif in mammals comprising hybritising at solated full-length, wild-type RB (wtRH) conserve a cell sample and detecting a mutated RB nucleic acid. The method is useful as a diagnostic fool for diagnosing retinoblastoms PR PNN or genomic INA are preferably used as probes to determine the detect region of the mRB gene through used as probes to determine the detect region of the mRB gene through among INA but ing analysis or using the allocased alleic. Cloned RB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RB gene; human; retinoblastoma gene; mutation detection; immunoscreening; retinoblastoma dayanesis, hereditary retinoblastoma; secondary cancer; osteosarcoma; fibrosarcoma; glioblastoma; breast cancer; tumourigenesis suppression; sa

The present invention describes a composition comprising a recombinant adenovirus expression vector, where the vector has an insert of exogenous DNA comprising a gene encoding a toration protein and adenovirus DNA in which all of the coding sequences of Ela, Elb, and protein IX, and part of El are deleted. The vectors are useful in gene though treatment of cancer, especially for treating p53 deficient tumours. The vector enables saler and more efficient gene therapy of cancer. The present sequence encodes human p119. RB retinoblastoms tumour suppressor which can be used as the loreign gene in the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         259 GACCTGCCTCTGGTCAGGCTTGAGTTTGAAGAACAGAAGCAGATTTTACTGCATTA (18

```

The present invention describes an adenoviral expression vector comprising a deletion in the protein IX gene and a gene encoding a foreign protein. This vector can be used in gene therapy, particularly to introduce tumour suppressor genes into camperous cells. Genes which may be used include p53, thymidine kinase and retinoblastoma tumour suppressor dene (kb). The present sequence is the retinoblastoma tumour

suppressor gene.

New recombinant ademovirus expression vector having a gene encoding for a foreign protein and a partial or total deletion of the ademoviral protein IX DNA, useful in gene therapy for treating or reducing hyperproliferative cells.	osurer Eig 3: 49pp; English.	The present CDNA sequence encodes refinebiastown (PR) tumour suppressor protein, designated as plloks. The investion relates to a recombinant adenovirus expression vector that actual related by the partial or fotal deletion of the adenoviral protein IX inva beginning at muciontides 457 or 455 and partial at 452 455, and harring a gene encoding a foreign protein such as tumour suppressor protein, plloks (refinebiastown) and p53. Adenovirus vector is used to screening tumour suppressor genes useful in gene therapy. The vector is protein, plantly useful treating or reducing hyperprofilerative cell disorders such as thyroid hyperplasia, Grave's disease, psociasis, benian prostatic hypertrophy, id Fraumeni syndrome, caucers specifically heptocellular carcinoma, nooplasms, leukaemias, lymphomas, etc. to faithology such as sickle cell anaemia and Tay-Sachs disease. The vector is also useful for the safe recombinant production of diagnostic and tay-berapeutic polypeptides and productions. ```

The present invention describes a recombinant adenovirus expression vector, which comprises a partial or total deletion of a protein IX BNA and a gence encoding a foreign protein. The recombinant adenovirus vector can have expression vector is particularly useful for treating or suppressing proliteration of a tumour, a q non-small cell lung cancer, hepatocarchoma or hepatocalcular carcinoma, melanoma, retinoblastoma, breast rumour, colorectal carcinoma, pressate tumour, bladder tumour, tumour of the reticuloendothelial fissues, wilm's tumour, astrony, overian estimout, astrony or renal cancer. The present, sequence encodes the retinoblastoma tennous superessor protein plights, which is quiven in the exemplification of the present invention. Nishlosure; Fig 3; 37pp; English. presidentation of a tumor -

This sequence encodes a modified retinoblastoma tument suppresson protein (RISP) of the invention. The proteins can be used for inhibiting cellular proliteration, when coadministered with a p5+ protein. The PTSPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The PTSPs have a broader spectrum of
